322 Compilers Assignment: 2
Register allocation, finishing up
Due Thursday April 30th, noon

Your job: Finish the L2 to L1 compiler. That is, wire everything together.

Handin instructions: Your handin must run on the t-lab machines (under linux).

Hand in your assignment by sending email with the subject `2` to `robby@eecs.northwestern.edu`. The email should include an attachment named *name*`.2.tar.gz`. The *name* should be your last name in all lowercase letters unless you are pair programming, in which case it should be both last names in alphabetical order, separated by `+`. For example, if Robert Jordan and Brandon Sanderson were pair programming and handing in this assignment, they'd send in a tarfile named `jordan+sanderson.2.tar.gz`.

The attachment must contain (at the top-level) a shell script or binary executable that is your compiler (and whatever supplementary files it needs). The compiler should be called `L2c`.

The compiler should accept a filename on the command-line ending with `.L2` and it should write a the L1 program to stdout (and nothing else to stdout).

The top-level directory can also contain executables that correspond to earlier assignments; they will be re-run in the test fest for this week.
