

EECS 211 Lab 7

Asteroids

Winter 2019

Today is an exercise in software archaeology. You will be given a complete program—your goal is to understand it well enough to modify and improve it.

Getting the starter code

For this lab, the starter code is provided as a ZIP file here: <http://users.eecs.northwestern.edu/~jesse/course/eecs211/lab/eecs211-lab07.zip>. Extract the archive file into a directory in the location of your choosing. Once you have your new directory containing the starter files, you can open it in CLion.

Getting oriented

Your first step in dealing with a new codebase is to gain a basic understanding of the structure and how it fits together. In particular, you need to understand what significant types (classes, structs, or enum classes) are defined by the code, and how they're related. Are any derived classes of any others (the *is-a* relation)? Do any contain instances of or references to instances of any other (the *has-a* relation)? Of particular interest in this assignment is the inheritance hierarchy, and how it produces the behaviors of different kinds of objects.

Possible goals

Here are some ways you could try modifying the program:

- Instead of ending the game after dying once, keep a life count and give the player multiple chances.
- Add a game-over screen that allows the player to try again.
- Make objects wrap around at the screen edge instead of colliding with it.
- Add power-ups, such as an extra life or faster spaceship.
- Rate-limit the firing mechanism to allow n shots before requiring an r second reloading delay.

Be careful, as CLion will only work correctly if you open the *main project directory* with the `CMakeLists.txt` in it. If you open any other directory, CLion may create a `CMakeLists.txt` for you, but it won't work properly.

Like classic Asteroids.

Power-ups should spawn randomly and disappear when acquired.
